

How to transition your dog to NDF2

The Transition:

Add a small amount of NDF 2 and meat to the kibble you are feeding your dog now and mix with water. As the week progresses, gradually increase the amount of NDF2, meat and water, at the same time decreasing the kibble by a corresponding amount, until you have phased out the kibble. (If you are feeding the same meat protein for six days, you may want to feed another protein - canned mackerel, any white fish or cottage cheese - on the seventh day.) At the end of the transition period, weigh your dog. Weigh him again after four weeks. Increase or decrease the amount you feed accordingly.
